

Title: Oil Viscosity Races

By Katie Gavenus, Children of the Spills, <http://childrenofthespills.org>.

Theme: Viscosity is an important characteristic of petroleum products that determine their uses.

Objectives:

- Students will measure the relative viscosity of different petroleum products and plant-based oils.
- Students will understand the concept of viscosity and how it affects the usefulness of petroleum products.

Duration: 45-60 minutes

Age Range: 6th-12th Grade

Materials:

- Variety of petroleum-based oils (kerosene, mineral oil, motor oil, gasoline, diesel, crude oil, etc.)
- Variety of plant-based oils (corn, peanut, sesame, soybean, palm, etc.)
- Glass pipettes with removable rubber tops OR pipettes and plastic straws
- Worksheets
 - Oil Viscosity Race
- Pencils
- Petri dishes or other small containers
- Disposable Gloves
- Oil-absorbent pads
- Tape
- 2 ft x 2 ft piece of countertop, laminate, or other non-porous plastic or glass
- Permanent marker
- Stopwatches
- Bowl with ice water
- Bowl with hot water

Background:

The viscosity of various petroleum products plays an important role in both the potential uses of that product and its behavior in the environment. Viscosity is defined as the property of resistance to flow in a fluid or semi-fluid; it is the “thickness” of a liquid, or the opposite of “runniness.” Molasses has a higher viscosity than water. In lubricating oils, the oil must be just the right viscosity – thin

enough to fit between metal parts and yet thick enough to adhere to the parts.

Preparation:

This experiment should take place in a well-ventilated area. Crude oil and the petroleum products to be tested include many toxic and flammable chemicals. Use proper safety precautions at all times, and make sure students are wearing gloves. Be sure to reuse or dispose of oil products correctly at the end of experiment.

Use a permanent marker to draw a line on the pipettes or plastic straws at a standardized volume.

Introduction:

Ask students to think about the various ways they use petroleum-based oils. Consider the different tasks these oils perform and how viscosity (or “thickness”) determines their ability to do so.

Activities & Procedures:

Present students with the variety of oils and tell them that they are going to conduct an experiment to identify the least and most viscous petroleum-based oils and plant-based oils. Caution students about safety procedures and pass out rubber gloves.

Begin by demonstrating a viscosity test on a vegetable-based oil. Submerge the tip of the pipette into the oil. Squeeze the rubber top and bring oil into the pipette until it reaches the calibration mark. Have a student ready with the stopwatch. Hold the pipette upright over a petri dish, pull off the rubber top, and begin timing (if the liquid got sucked higher up into the pipette, wait until it reaches the bottom of the pipette before starting the timer). Stop timing when the last of the liquid has exited the pipette.

Divide students into lab groups of 2-5 and have them test the viscosity of at least 3 vegetable-based oils and at least 3 petroleum-based oils. They should record their results on the worksheet. Have each group share their results.

Then, each group should choose one oil to enter into the race. The goal of the race is to get to the finish line last (into the petri dishes at the end of the countertop piece). They will achieve this by having the most viscous liquid.

Set the piece of countertop against the wall at about an 80 degree angle. Place the petri dishes along the bottom to catch the oils. Have each group select their oil and fill their pipette. Then, tape the pipettes to the top of the piece of countertop and have an individual from each group remove the rubber topper at the same time. Let the (slow) race begin. Whichever oil reaches the petri dish last is the winner. Wipe

off the plastic with the oil absorbent pad. Float a container of the winning oil in the hot water and a container in the ice bath. Fill three pipettes, one with hot oil, one with cold oil, and one with room-temperature oil. Repeat the race with these three pipettes.

Wrap-Up:

Discuss how viscosity affects the usefulness of different oils, and also how viscosity affects the way oil behaves in the environment. Examine the results from the temperature tests and ask students why it is important to understand how viscosity is affected by temperature. Are any of these oils used at high or low temperatures? How would temperature affect the way oil behaves in the environment?

Evaluation:

Assess student worksheets for completeness and comprehension. Answers will vary based on the types of oil provided, so use common sense and your own observations in the assessment of student answers. Note student cooperation and participation during group work.

Oil Viscosity Races Data Sheet

Test the viscosity of at least 3 vegetable-based oils and 3 petroleum-based oils. Submerge the tip of the pipette into the oil. Squeeze the rubber top and bring oil into the pipette until it reaches the calibration mark. Have a student ready with the stopwatch. Hold the pipette upright over a petri dish, pull off the rubber top, and begin timing (if the liquid got sucked higher up into the pipette, wait until it reaches the bottom of the pipette before starting the timer). Stop timing when the last of the liquid has exited the pipette. Record the time, in seconds, in the viscosity row for each type of oil.

	Vegetable-Based Oils			Petroleum-Based Oils		
Type of Oil						
Viscosity (seconds)						

Which oil has the highest viscosity (slowest to exit the pipette)?

What sorts of uses is this oil good for?

Which oil has the lowest viscosity (fastest to exit the pipette)?

What sorts of uses is this oil good for?

Which oil do you want to use in the viscosity races?

Oil Viscosity

Science As Inquiry and Process: Students develop an understanding of the processes and applications of scientific inquiry.

SA1

Students develop an understanding of the processes of science used to investigate problems, design and conduct repeatable scientific investigations, and defend scientific arguments

The student demonstrates an understanding of the processes of science by:

[6, 7, 8, 9] SA1.1 asking questions, predicting, observing, describing, measuring, classifying, making generalizations, inferring, and communicating

Concepts of Physical Science: Students develop an understanding of the concepts, models, theories, universal principles, and facts that explain the physical world.

SB1

Students develop an understanding of the characteristic properties of matter and the relationship of these properties to their structure and behavior.

The student demonstrates understanding of the structure and properties of matter by:

[7] SB1.1 using physical properties (i.e., density, boiling point, freezing point, conductivity) to differentiate among and/or separate materials (i.e., elements, compounds, and mixtures)

SB3

Students develop an understanding of the interactions between matter and energy, including physical, chemical, and nuclear changes, and the effects of these interactions on physical systems.

The student demonstrates an understanding of the interactions between matter and energy and the effects of these interactions on systems by:

[6] SB3.1 recognizing that most substances can exist as a solid, liquid, or gas depending on temperature

[7] SB3.1 recognizing that most substances can exist as a solid, liquid, or gas depending on the motion of their particles

[8] SB3.1 exploring changes of state with increase or decrease of particle speed associated with heat transfer
