

# Embryo Toxicity

what we learned in the past,  
and the significance to the future

Or

Reflections on 40 years of oil  
toxicity research

**Jeep Rice**

**Auke Bay Laboratory**

**Alaska Fisheries Science Center**

# Reflections on 40 years of oil toxicity research

**First Job:**  
**TAPS EIS**

**First Job:**

**TAPS EIS = Risk Assessment**

## **Pre-spill questions-**

**How sensitive are the local species?**

**What about the early life stages?**

**How will happen to the ecosystem?**

**Oh by the way, Not much \$\$\$ to invest in the pre-spill questions**

## **Pre-spill questions-**

**How sensitive are the local species?**

**What about the early life stages?**

**How will happen to the ecosystem?**

# **Fast Forward > > > Exxon Valdez**

## **Same Pre-spill Questions-**

**How sensitive are the local species?**

**What about the early life stages?**

**How will happen to the ecosystem?**

**Oh by the way - we have \$\$\$**

**Same Pre-spill Questions-**

**How sensitive are the local species?**

**What about the early life stages?**

**How will happen to the ecosystem?**

**First lesson:**

**lack of pre-spill info hurts**

**Best Studies had**

**Pre-spill Population info**

**commercial species**

**Species of un-common interest**

**Second lesson:**

**Lab studies were not all  
that helpful**

**Tough to relate  
an acute LC 50**

**to relevant environmental situation**

**e.g. 1989, Pink Salmon embryos in the wild  
elevated P450, What did it mean?**

# Pink Salmon study- Paradigm changes

ADFG found elevated  
embryo mortalities  
in oiled streams

ABL Lab studies used

Environmentally relevant doses

-Effects at **PPB** concentrations

-Long term exposures (**Months**)

-**Delayed effects**

# Delayed Growth:

Lab Research

## Effects on Adult Salmon Returns

# **Fast Forward > > > another decade**

## **Cosco Busan, DWH**

### **Same Pre-spill Questions-**

**How sensitive are the local species?**

**What about the early life stages?**

**How will happen to the ecosystem?**

© KPA Zuma / Rex Features

**Fast Forward >>> another decade**

**Cosco Busan, DWH**

**Same Pre-spill Questions-**

**Tools are getting better**

**Toxicity mechanism has shifted**

**Narcosis >>to embryo toxicity**

**John Incardona, Peter Hodson labs have produced**

**What tools do we need?**

**1. Tools to predict impacts**

**2. Tools to measure impacts**

# **What tools do we need?**

- 1. Tools to predict impacts**
- 2. Tools to measure impacts**

## **Baselines**

- 1. Population (Pre/ Post)**
- 2. Biochemical/biological (Pre/ Post)**

# Back to the P450 example

**P450 was elevated in embryos,  
and predicts poor adult returns**

# Back to the P450 example

**BUT---This prediction does not work if you sample a later stage (Juvenile)- So we need biomarkers that last through time**

# What tools do we need?

**We need to sample**

- 1. assess whether exposed or not**
- 2. Predict long term survivability**

**Biomarkers that persist through time**  
**e.g. gene expression**
